

AI prompt:

Prompt 1. *Use the sample file as the structure to create a champion document based on the following requirements ensure the diagrams found in the sample are included for my feature. Five parts: Introduction —what your feature does, and what it does NOT do. Use Case — actors + numbered basic sequence; exceptions branch from a step (“Step 3a”). Interface Contract — inputs / outputs / events, each typed and testable (not vague). DFD — Gane–Sarson, context → your feature's zoom; no black holes or miracles. Timeline — work items + honest hour estimates (TL4 tracks you against these). Feature Requirements: (PASTE FEATURES AND REQUIREMENTS HERE found in your team github under doc/TL5**) "TL1 — UI/HUD, Game State & Menu System

- ****Purpose:**** Owns all UI screens and the overall game-flow state machine — the shell the rest of the game runs inside.
- ****Responsibilities:**** HUD display (health/score/currency), pause/resume, game-over + restart, main menu, state transitions.
- ****Public interface: ****
 - GameStateManager.CurrentState (read-only property)
 - GameStateManager.OnStateChanged (event)
 - GameStateManager.RequestPause() / RequestResume() / RequestRestart()
 - HUDController.UpdateScore(int score) / UpdateHealth(int hp)
- ****Internal classes:**** abstract GameState, MenuState, PlayingState, PausedState, GameOverState, GameStateManager, HUDController.
- ****Class hierarchy / dynamic binding:**** GameState.Enter()/Update() are virtual; each state overrides them. Removing virtual makes the HUD/pause behavior identical across all states (e.g., HUD never hides on pause).
- **GOF pattern:**** State pattern (large) for overall game flow.
- ****GRASP:**** Controller (GameStateManager coordinates flow), Low Coupling (UI only listens to events), Pure Fabrication (HUDController separates display from state logic).
- ****Dependencies:**** Subscribes (read-only, via events) to OnPlayerDied,

OnPowerUpCollected, OnEnemyDefeated, and currency updates from the other five features.

- ****Testing strategy:**** Unit-test state transitions with mocked triggers; boundary tests at game start/end; stress test rapid pause/resume toggling.
- ****Completion criteria:**** HUD updates correctly in real time; pause/resume/restart all function; game-over screen displays and restarts cleanly.
- ****Effort:**** Design 9h · Coding 24h · Testing 10h · Documentation 9h = ****52h "****

Prompt 2. I need you to update some of the diagrams, i need all of the includes and extends to have dotted lines. I also need the extends arrows to be flipped 180 degrees to show it extends the other way. I also need you to verify that all of the lines match what the picture i include shows. I also need you to include in my diagrams 0 and stuff, i need you to highlight my specific features in a different color please

Prompt 3. The arrows are also wrong directionally you need to pay attention to the direction of the includes and extends

Prompt 4. can you make these the parent tasks for the timeline and then the tasks that you made in the document make those the subtasks of these parent tasks i uploaded

Prompt 5. here is the diagram 0 you need to use and replace the other diagram 0 with. Also I need you to update the diagram under it to make sure everything is good.
